Olay Complete UV365 Daily Moisture  
Cream with Sunscreen, 2 oz

# HEALTH HIGHLIGHTS

**March 22 is . . .**

**World Water Day**

*Water is one of the planet's most precious resources. That's why it's important to stay aware of the issues surrounding it. World Water Day is observed each year on March 22 to promote the responsible use of water and access to safe water for everyone.*

## Access to Water

Global access to safe water, adequate sanitation, and proper hygiene resources reduce illness and death from disease and lead to improved health, poverty reduction, and socio-economic development. Globally, 2 billion people do not have safely managed drinking water services, 3.6 billion do not have safely managed sanitation service, and 2.3 billion do not have access to a handwashing facility with water and soap at home.

## Diarrheal Diseases

Many diarrheal diseases, such as typhoid fever and cholera, spread through unsafe water and sanitation. Although rare in the United States, outbreaks of typhoid and cholera continue to occur in low-resource countries. Together, these diseases sicken millions and kill an estimated 257,400 people each year.

Safeguarding water sources and developing and maintaining water and sanitation systems to keep feces out of water, food, and the environment are critical to preventing diarrheal diseases. In areas without a consistent source of safe water, people often resort to using sources that are more likely to contain germs that cause diarrhea.

The Centers for Disease Control and Prevention (CDC) works to prevent, detect, and respond to infectious disease outbreaks in the United States and around the world and provides technical support in cases of emergencies. In addition, the CDC has partnered with the World Health Organization to launch Ending Cholera: The Global Roadmap to 2030, a collaborative approach to cholera prevention and control.
