HEALTH HIGHLIGHTS

October 4 is ...

Birthday of Adrian Kantrowitz

U.S. heart surgeon and medical investigator Adrian Kantrowitz was born on October 4, 1918 in New York City, to general practitioner Bernard Abraham and his wife Rose. Adrian Kantrowitz was responsible for pioneering developments in circulatory assist devices, artificial organs, medical electronics, and heart transplantation.

His interest in medical research began as a child through kitchen experiments conducted with his older brother Arthur, who eventually became a physicist and cofounder of Avco Research Laboratories. Adrian received his bachelor's degree in mathematics from New York University in 1940 before attending the Long Island College of Medicine, now known as the State University of New York (SUNY) Downstate Medical School. Due to the growing need for doctors during World War II, he underwent an accelerated program and was awarded his medical degree in 1943.

A nine month internship at the Jewish Hospital of Brooklyn fostered Kantrowitz's initial career interest in neurosurgery. While there, he proposed a new type of clamp for performing craniotomies during intracranial surgery that became the subject of his first published paper, "A Method of Holding Galea Hemostats in Craniotomies," in 1944. World War II halted Kantrowitz's research work for two years while he served as a battalion surgeon in the U.S. Army Medical Corps. After being discharged in 1946 with the rank of major, Kantrowitz switched his specialty to general surgery because of the lack of available training positions in neurosurgery. He was intensely interested in the possibility of surgical procedures to help the failing heart, but at that time there were no training programs in cardiac surgery. He would spend the rest of his career devoted to cardiovascular research, typically working eighteen-hour days six days a week.

On December 6, 1967, three days after Christiaan Barnard's historic surgery in South Africa, Adrian Kantrowitz completed the United States' first and the world's second human heart transplant. A 2.5-week-old male infant suffering from severe tricuspid atresia received the heart of a two-day-old male infant dying of anencephalitis.
