

WELL LIFE COMPOUNDING PHARMACY

LOW DOSE NALTREXONE

Inflammation is linked to many conditions such as **fibromyalgia**, **Crohn's disease**, **Multiple Sclerosis**, and **autism** in children. Using low doses of naltrexone (starting at 0.5mg and using up to 4.5mg) has been shown to work as a novel anti-inflammatory in the central nervous system by modulating microglial cells. Our pharmacy can compound capsules for the initial dose of 0.5mg, and up to 4.5mg (to be taken at bedtime). We also formulate it as a topical cream, which is an easy mode of application for children.
