

WELL LIFE COMPOUNDING PHARMACY

COMPOUNDS WE CAN PROVIDE THAT MAY HELP YOUR VETERINARY PRACTICE.

CHRONIC RENAL FAILURE/HYPOPARATHYROIDISM – Calcitrol can be compounded to very small doses and volumes as well as many formulations to fit most animals' needs.

HYPERTHYROIDISM – We are able to compound very palatable suspensions of methimazole, as well as transdermal formulations for ease of administration.

GABAPENTIN – For animals with nerve issues (neuropathy, interstitial cystitis etc.) gabapentin is a medication easy to compound and that has had a lot of success.

URSODIOL – Used to treat and prevent gallstones, as well as treat certain chronic liver diseases. Ursodiol can be compounded into many dosage forms including oral suspensions and capsules.

TRANSDERMAL FORMULATIONS – Many medications can be compounded into specialized creams or gels for simplistic transdermal use which include: methimazole, tramadol, acepromazine, amitriptyline, amlodipine, atenolol, buspirone, clomipramine, famotidine, ivermectin, phenobarbital, glipizide, metoclopramide, loperamide & enrofloxacin.

DOXYCYCLINE – While many manufacturers have decreased their production, our pharmacy has been able to keep a steady supply of this drug in stock to meet the demand and compound needs of our veterinary patients.

DES (DIETHYLSTILBESTROL) – This drug has been a very popular treatment for urinary incontinence in animals. We only compound DES as a capsule, as the active ingredient is too bitter for liquid dosage forms.

BRONCHODILATORS – Well Life Pharmacy stocks aminophylline and theophylline for our veterinary patients. These can be used to treat many disease states such as asthma, bronchitis, congestive heart failure, and pulmonary edema.

*Call today to speak with one of our pharmacists about any questions you may have regarding the above solutions and for pricing.
