

PREVALENCE OF RECENT CORONAVIRUS VARIANTS

Data presented here was made available by GISAID with lineage assignment determined using Pangolin. On this page you will find information on the prevalence of recent coronavirus variants by week along with total counts for variant of concern (VOC), variants of interest (VOI), and variants being monitored (VBM).

Collection date

12/5/2021

Recent Variant Prevalence

Last updated: 2/14/2022 5:44:34 PM

% of Total

Week: 1/23/22

*Estimated prevalence per week period beginning on the date. This estimate is based on sequencing from a non-targeted convenience sample of cases. This estimate excludes cases sequenced from targeted contact tracing. Classifications of Delta lineages by the Pango nomenclature system are in flux, however, all AY designations are sublineages of the Delta variant. An AY designation doesn't imply any functional biological difference from B.1.617.2 rather a way of further classifying the Delta clades. Sub-lineages with less than 5% prevalence are grouped with B.1.617.2 in the plot.
